Attention Deficit-Hyperactivity Disorder (ADHD) is one of the most common psychiatric disorders in children, which may even persist in adult life. It is a condition that affects the different neurobehavioral functions of a child and which, as a result, is manifested by a number of behavioral disorders, its major symptoms being hyperactivity, impulsiveness and lack of attention. Though the specific cause of ADHD has not yet been established, it is known to be a neurobiological disorder widely influenced by genetic and psychosocial factors. ADHD represents an important public health concern due to its high prevalence and the fact that it begins during the first stages of childhood and has a significant impact on the academic, family and social life of the patient. Early diagnosis and initiation of an interdisciplinary treatment are determinant factors to the prognosis and progression of this disease.
